CLIMATE CHANGE IN THE INDIAN MIND

This study was conducted by the Yale Project on Climate Change Communication in collaboration with GlobeScan Incorporated. Fieldwork in India was conducted by C-Voter and Markelytics. Funding was provided by the Shakti Sustainable Energy Foundation and the Rice Family Foundation.

FOREWORD

Dr. Anthony Leiserowitz is a remarkable scientist who has reached great heights assessing public attitudes and perceptions on a range of environmental issues. His ongoing work assessing the environmental perceptions and priorities of the US public, particularly in the area of climate change, repeatedly gets the attention of a range of stakeholders, including very influential decision-makers. He not only provides us with vital data based on extensive national surveys, but his insights also provide us with a deep understanding of the human, social and political realities underlying these issues. I might mention that every time he sends me a summary of his latest research in the US, I circulate it to the elected officers of the Intergovernmental Panel on Climate Change (IPCC) because I cannot think of a more reliable assessment of public attitudes on climate change. The IPCC of course is a scientific body, but it has now to deal increasingly with the challenge of informing the public about the findings of IPCC reports.

It is heartening that Dr. Leiserowitz has expanded his research on public responses to climate change to other countries around the world. I am particularly happy that in this study, which is based on rigorous scientific methods, he has assessed public climate change awareness, knowledge, attitudes, and policy support in India. The results make very interesting and highly useful reading. I am sure that this study will receive substantial attention and should inform stakeholders across India. Dr. Leiserowitz has asked the Indian public a series of questions that deal with vital issues at the top of people's concerns, such as droughts, floods and the public's ability to recover from climate-related disasters. He has also very ingeniously asked Indians about intergenerational issues, including the need to balance current consumption with its impact on the opportunity for future generations to meet their own needs, the essential core of sustainable development.

I hope that this pioneering work will inspire other researchers in India to carry out additional climate change-related surveys and assessments at the national as well as the subnational levels across the wide diversity of this country.

> – Dr. Rajendra K. Pachauri Chair, UN Intergovernmental Panel on Climate Change (IPCC) Director General, The Energy & Resources Institute (TERI)

ACKNOWLEDGMENTS

A project of this size, scope and duration requires the hard work and commitment of many people. We would especially like to thank Joanna Nicholls, Eric Whan, Oliver Martin, Chris Coulter, and Lloyd Hetherington of GlobeScan and the many survey managers and fieldworkers of C-Voter and Markelytics.

We also extend our gratitude to our many project advisors, including Dr. Ram Babu Bhagat (IIPS/Mumbai), Unmesh Brahme (Climate Civics Institute), Ishita Chaudhry (Youth Parliament Foundation), Navroz Dubash (Centre for Policy Research), Bahar Dutt (CNN-IBN), Pratik Ghosh (TERI), Ramachandra Guha (Independent Scholar), Caroline Howe (Loop Environmental Solutions), Linda Jhalani, Dr. T. Jayaraman (TISS Mumbai), Shashi Kant Kapoor (All India Radio), Dr. R. Krishnan (Indian Institute of Tropical Meteorology), Dr. Sanjay Kumar (CSDS/Lokniti), Don Mohanlal (Khemka Foundation), Arup Mullick (TERI), Sreeja Nair (TERI), Dr. Rajendra Pachauri (TERI), Varad Pande (Indian Ministry of Environment & Forests), Dr. Jyoti Parikh (Integrated Research and Action for Development), Anoop Poonia (IYCN), Suresh Prabhu (Council on Energy, Environment & Water), D. Raghunandan (Delhi Science Forum & Centre for Technology & Development), N. Bhaskara Rao (Centre for Media Studies), Ann Rogan (Loop Environmental Solutions), Shyam Saran (Centre for Policy Research), Dr. Kalyanakrishnan Sivaramakrishnan (Yale), V. Subramanian (Indian Wind Energy Association), Alka Tomar (Centre for Media Studies), P.N. Vasanti (Centre for Media Studies), and Dr. Yogendra Yadav (CSDS/Lokniti). Your penetrating insights on the complexities and richness of climate change, the environment and Indian society were incredibly helpful. Thank you very much for your help.

We also would like to thank our colleagues at Yale and the School of Forestry & Environmental Studies, including Dean Peter Crane, Lisa Fernandez, Jay Hmielowski, Kartikeya Singh, George Joseph, Tim Northrop, and Eugenie Gentry, and our financial sponsors: the Shakti Sustainable Energy Foundation and the Rice Family Foundation. Last, but certainly not least, we thank our families for their love and support, especially during the long stretches of fieldwork far away from home.

EXECUTIVE SUMMARY

In November and December of 2011, a research team from Yale University, GlobeScan Incorporated, and C-Voter conducted a national survey of 4,031 Indian adults, using a combined urban and rural sample.¹ The study was designed to investigate the current state of public climate change awareness, beliefs, attitudes, policy support, and behaviors, as well as public observations of changes in local weather and climate patterns and self-reported vulnerability to extreme weather events. The survey margin of error was +/-1.54%. Overall, the survey found that:

Observations of Local Environmental Change

- 80 percent of respondents said that the amount of rainfall in their local area had changed in the past 10 years either decreasing (46%) or increasing (34%);
- 54 percent said that hot days in their local area have become more frequent, while 23% said they had become less frequent;
- 21 percent said that severe storms and droughts had become more frequent, while 15% said floods had become more frequent;
- 38 percent said the monsoon has become more unpredictable in their local area compared to the past.

Climate Vulnerability & Resilience

- 65 to 58 percent of respondents said that a 1-year long severe drought or flood in their local area would have a large or medium impact on their lives, including their household's drinking water and food supply, their health, income or house, and their broader community;
- 64 percent said it would take their household several months to several years to recover from a severe drought or flood;
- 42 percent reported that in the past year, they or a member of their household had gone without enough clean water in a day, while 24 percent said that they had sometimes to very often gone without two full meals a day;
- 28 percent said that their income does not cover their needs and they have difficulties.

Global Warming Awareness and Beliefs

- Only 7 percent of respondents said they know "a lot" about global warming, while 41 percent had either "never heard of it" or said "I don't know";
- When given a short definition of global warming, however, 72 percent said that they believe it is happening;

¹ Please note that all results are from an approximately 75% urban and 25% rural sample. This sample is more urban than India as a whole, thus interpretations of the results should keep this in mind.

- 56 percent said it is caused mostly by human activities, while 31 percent said it is caused mostly by natural changes in the environment;
- 61 percent said they are worried about global warming and 67 percent said the issue is important to them personally;
- Large majorities said global warming will harm future generations (67%), plant and animal species (67%), people in India (66%), people in their own community (62%, and themselves and their own family (57%);
- 50 percent said they have already personally experienced the effects of global warming, while 43 percent said that global warming is already harming or will harm people in India within the next 10 years.

Trust in Different Messengers

- Scientists were the most trusted sources of information about global warming (73%), followed by the news media (69%), environmental organizations (68%), and their own family and friends (67%);
- Governments and religious leaders were trusted by about half of respondents.

Support for Climate and Energy Policies

- 41 percent of respondents said the government of India should be doing more to address global warming;
- 54 percent said that India should be making a large or moderate-scale effort to reduce global warming, even if it has large or moderate economic costs;
- 38 percent said that India should reduce its own emissions of the gases that cause global warming immediately, without waiting for other countries, 18 percent said that India should reduce its own emissions only if rich countries go first, 13 percent said that India should reduce its own emissions only if all the other countries of the world reduce their emissions at the same time, and 13 percent said India should not reduce its emissions under any circumstances;
- 70 percent favored a national program to teach Indians about global warming;
- 67 percent favored a national effort to help local communities build check dams to increase local water supplies;
- A majority of respondents favored a variety of policies to waste less fuel, water, and energy, even if this increased costs;
- A majority of respondents said that environmental protection either improves economic growth and provides new jobs (35%) or has no effect on economic growth or jobs (16%);

• 53 percent said that protecting the environment is more important, even if it reduces economic growth, while 28 percent said that economic growth is more important, even if it leads to environmental problems.

Values

- Overall, respondents tended to hold stronger egalitarian than individualistic values;
- Respondents were evenly divided between those that said "individuals can make their own destiny" vs. "everything in life is the result of fate."

Media Use

- 65 percent of respondents watch television 5 or more days a week, compared to news-papers (54%), radio (25%), movies (21%), or the internet (18%);
- News about sports and television and movie stars were the most closely followed types of news (39%), followed by world affairs (36%), local politics (36%), environmental issues (35%), national politics (34%), the local weather forecast (32%), and business and financial news (31%);
- 80 percent of respondents watch or listen to serial dramas on television or radio.

INTRODUCTION

India is one of the world's most vulnerable countries to climate change (Cruz et al., 2007; NAPCC, 2008; INCCA, 2010). About half of India's population is dependent upon agriculture or other climate sensitive sectors (Bureau of Labour Statistics, India, 2010), and about 76 percent of the population lives on less than \$2 a day (World Bank, 2008). The 2010 United Nations Human Development Report (HDR, 2010) found that poverty levels in eight Indian states are as acute as those in the 26 poorest countries in Africa. These eight Indian states are home to about 421 million people in poverty, 11 million more people in poverty than in the 26 poorest African countries combined. India is vulnerable to sea level rise and extreme weather events, and will increasingly face threats to human health, water availability, and food security (Cruz, et. al., 2007). Additionally, about 12 percent (40 million hectares) of India is flood prone, while 16 percent (51 million hectares) is drought prone (CWC, 2011) – thus India is also vulnerable to potential climate change-induced shifts in precipitation patterns.

In per capita terms, the average Indian emitted only 1 ton of carbon dioxide in 2009, while the average American was responsible for 17 tons, reflecting the large economic differences between the two nations (IEA, 2011). Additionally, the U.S. is the world's single largest historic emitter, alone responsible for about 27 percent of global emissions from 1751-2008, while India ranks seventh, with less than 3 percent of historical emissions (Boden et al., 2011). However, India today is one of the world's fastest growing economies. As a nation, India is now the world's third largest emitter of carbon dioxide, having almost tripled its annual emissions between 1990 and 2009, from less than 600 to nearly 1600 metric tons. India's annual emissions of carbon dioxide are projected to further increase almost 2.5 times between 2008 and 2035 (IEA, 2011).

Climate change and energy are now a focus of local, state, and national attention around the world. India has long been a key player in international negotiations and has begun implementing a diverse portfolio of policies nationally and within individual states to improve energy efficiency, develop clean sources of energy, and prepare for the impacts of a changing climate. An effective national strategy, however, must take into account the climate change and energy-related beliefs, attitudes, policy preferences, and behaviors of the Indian people, who will play a vital role in the success or failure of this strategy through their decisions as citizens, consumers, and communities. Building public acceptance, support, and demand for new policies to both limit the severity of global warming and prepare for the impacts of a changing climate will require education and communication strategies based upon a clear understanding of what Indians already know, believe, and support, as well as what they currently misunderstand, disbelieve, or oppose. In an effort to help establish a baseline understanding of public responses to these issues in India, the Yale Project on Climate Change Communication conducted a national survey in November and December of 2011 to investigate the current state of public climate change awareness, beliefs, attitudes, policy support, and behaviors, as well as public observations of changes in local weather and climate patterns and self-reported vulnerability to extreme weather events. Climate change and Indian society are both highly complex and a single study cannot do service to their full richness and diversity. Nonetheless, this study does take an in-depth and rigorous look at some of the key dimensions of these issues in India. This research is intended to contribute to both scientific and public understanding and dialogue about these issues and provide useful information for the Indian climate change community.

This report provides the topline survey results, as well as the results broken down by different demographics and geographic areas. A second report is forthcoming which will segment the survey respondents into distinct audiences requiring tailored climate change education and communication.

EXECUTIVE SUMMARY

In November and December of 2011, a research team from Yale University, GlobeScan Incorporated, and C-Voter conducted a national survey of 4,031 Indian adults, using a combined urban and rural sample.¹ The study was designed to investigate the current state of public climate change awareness, beliefs, attitudes, policy support, and behaviors, as well as public observations of changes in local weather and climate patterns and self-reported vulnerability to extreme weather events. The survey margin of error was +/-1.54%. Overall, the survey found that:

Observations of Local Environmental Change

- 80 percent of respondents said that the amount of rainfall in their local area had changed in the past 10 years either decreasing (46%) or increasing (34%);
- 54 percent said that hot days in their local area have become more frequent, while 23% said they had become less frequent;
- 21 percent said that severe storms and droughts had become more frequent, while 15% said floods had become more frequent;
- 38 percent said the monsoon has become more unpredictable in their local area compared to the past.

Climate Vulnerability & Resilience

- 65 to 58 percent of respondents said that a 1-year long severe drought or flood in their local area would have a large or medium impact on their lives, including their household's drinking water and food supply, their health, income or house, and their broader community;
- 64 percent said it would take their household several months to several years to recover from a severe drought or flood;
- 42 percent reported that in the past year, they or a member of their household had gone without enough clean water in a day, while 24 percent said that they had sometimes to very often gone without two full meals a day;
- 28 percent said that their income does not cover their needs and they have difficulties.

Global Warming Awareness and Beliefs

- Only 7 percent of respondents said they know "a lot" about global warming, while 41 percent had either "never heard of it" or said "I don't know";
- When given a short definition of global warming, however, 72 percent said that they believe it is happening;

¹ Please note that all results are from an approximately 75% urban and 25% rural sample. This sample is more urban than India as a whole, thus interpretations of the results should keep this in mind.

- 56 percent said it is caused mostly by human activities, while 31 percent said it is caused mostly by natural changes in the environment;
- 61 percent said they are worried about global warming and 67 percent said the issue is important to them personally;
- Large majorities said global warming will harm future generations (67%), plant and animal species (67%), people in India (66%), people in their own community (62%, and themselves and their own family (57%);
- 50 percent said they have already personally experienced the effects of global warming, while 43 percent said that global warming is already harming or will harm people in India within the next 10 years.

Trust in Different Messengers

- Scientists were the most trusted sources of information about global warming (73%), followed by the news media (69%), environmental organizations (68%), and their own family and friends (67%);
- Governments and religious leaders were trusted by about half of respondents.

Support for Climate and Energy Policies

- 41 percent of respondents said the government of India should be doing more to address global warming;
- 54 percent said that India should be making a large or moderate-scale effort to reduce global warming, even if it has large or moderate economic costs;
- 38 percent said that India should reduce its own emissions of the gases that cause global warming immediately, without waiting for other countries, 18 percent said that India should reduce its own emissions only if rich countries go first, 13 percent said that India should reduce its own emissions only if all the other countries of the world reduce their emissions at the same time, and 13 percent said India should not reduce its emissions under any circumstances;
- 70 percent favored a national program to teach Indians about global warming;
- 67 percent favored a national effort to help local communities build check dams to increase local water supplies;
- A majority of respondents favored a variety of policies to waste less fuel, water, and energy, even if this increased costs;
- A majority of respondents said that environmental protection either improves economic growth and provides new jobs (35%) or has no effect on economic growth or jobs (16%);

PART 1: Observations of Local Environmental Change

India is geographically very diverse and different parts of the country experience very different patterns of local rainfall, extreme weather events, and the monsoon. Nonetheless, a majority of survey respondents across India said that they have observed changes in local climate and weather patterns in their own area.

Overall, 46 percent of respondents said that the average amount of rainfall in their own local area had decreased over the past 10 years, 34 percent said that it had increased, and 17 percent said it had stayed about the same (Fig. 1). A majority of respondents (54%) said that hot days have become more frequent in their local area, 23 percent said they have become less frequent, and 19 percent said there had been no change (Fig. 2). By contrast, fewer respondents (21%) said that severe storms had become more frequent, while 31 percent said they had become less frequent and 35 percent said they had not changed. Similarly, 21 percent said that droughts had become more frequent, while 34 percent said they had become less frequent, and 34 percent said they had not changed. Finally, only 15 percent of respondents said floods in their local area had become more frequent, while 33 percent said they had become less frequent, and 42 percent said they had not changed.

Many respondents said they had observed changes in the monsoon. Nearly 4 out of 10 said that the monsoon in their own local area had become less predictable compared to the past, while 25 percent said it had become more predictable and 27 percent said it had not changed (Fig. 3).

Figure 1: Changes in Rainfall

Over the past ten years, would you say that the average amount of rainfall each year in your local area has been increasing, decreasing, or has it stayed about the same?

Figure 2: Changes in Extreme Weather Events

In your local area, have the following become more frequent, less frequent, or have they not changed compared to the past?

Figure 3: Changes in the Monsoon

In your local area, does the monsoon seem more predictable, less predictable, or has it not changed compared to the past?

PART 2: Climate Vulnerability & Resilience

A majority of respondents (65 to 58%) said that a 1-year long severe drought or flood in their local area would have a large or medium impact on their lives, including their own household's drinking water and food supply, their health, income or house, and their broader community (Fig. 4 & 5). Fewer than 1 out of 5 said that a severe drought would have no impact on them. Nearly 2 out of 3 respondents said that it would take their household or community several months or more to recover from a severe flood or drought (Fig. 6). In fact, 1 out of 5 respondents said it would take them several years to recover from such an event.

Nearly 1 out of 4 respondents (24%) reported that in the past year they or a member of their household had to go without two full meals a day sometimes (17%), often (3%), or very often (4%) (Figure 7). More than 2 out of 5 (42%) reported that they or a member of their household had to go without enough clean water in a day sometimes (31%), often (7%), or very often (4%) (Fig. 10).²

Nearly a third of respondents (30%) said that some (18%), about half (5%), or most or all (7%) of their household's diet comes from food they grow, hunt, fish, or gather for themselves (Fig. 8). Just over a quarter (27%) report that some to all of their food comes from food given to them by other people in their community (Fig. 9).

Only 31 percent of respondents said that their household income covers their needs and they are able to save money. Nearly 4 out of 10 said that their income covers their needs, but by just enough. 17 percent said their income does not cover their needs and they have some difficulties, while 11 percent said their income does not cover their needs and they have great difficulties (Fig. 11). Almost half of respondents (48%) said that if prices for electricity and fuel doubled, their household would have to go without using electricity or fuel sometimes (28%), often (11%), or very often (9%) (Fig. 12).

A majority of respondents said that they feel either very (31%) or somewhat connected (29%) to other people in their own community (Fig. 13). However, 4 out of 10 said they feel not very (16%), not at all connected (13%), or said they don't know (11%). When asked how many relatives and friends they could count on if they were in trouble and needed help, almost 3 out of 10 respondents (29%) said "none," and nearly 4 out of 10 (37%) said only 1 to 5 (Fig. 14).

² Note that all results are from an approximately 75% urban and 25% rural sample. A nationally representative (i.e., more rural) sample would most likely result in higher percentages of Indians reporting these difficulties.

Figure 4: Impact of a Severe Drought

If a 1 year-long severe drought happened in your local area, how big of an impact would it have on each of the following?

Figure 5: Impact of a Severe Flood

If a severe flood happened in your local area, how big of an impact would it have on each of the following?

Figure 6: Household Recovery Time After a Flood or Drought

If each of the following happened in your local area, how long do you think it would take for your household to recover? Would you say it would take you a month, several months, a year, or several years?

Figure 7: How Often Gone Without Two Full Meals a Day

Over the past one year, how often, if at all, did you or any member of your household have to go without two full meals a day? Would you say very often, often, sometimes or never?

Figure 8: How Much of Diet Produced Yourself

How much of your household's diet comes from food you grow, hunt, fish or gather for yourselves? Would you say most or all of it, about half of it, some of it, or none of it?

Figure 9: How Much of Diet Given by Others in Community

70 69% 60 50 40 30 20 16% 10 5% 6% 5% 0 Most or all About half Some of it None of it Don't know of it of it *n* = 3904

How much of your household's diet comes from food that other people in your community give to you? Would you say most or all of it, about half of it, some of it, or none of it?

Figure 10: How Often Gone Without Enough Drinking Water

Over the past one year, how often did you or any member of your household have to go without enough clean drinking water in a day? Would you say very often, often, sometimes, or never?

Figure 11: Does Income Cover Needs

I will now read out a few statements about your household income. Please tell me which one of the following statements is closest to your situation.

n = 3894

Figure 12: If Electricity / Fuel Prices Doubled, How Often Would Go Without Using

If prices for electricity and fuel doubled, how often would your household have to go without using electricity or fuel? Would you say very often, often, sometimes, or never, or do you not use electricity or fuel?

Figure 13: Feel Connected to Your Community

How connected do you feel to other people in your community? Do you feel very connected, somewhat connected, not very connected, or not at all connected?

n = 3823

Figure 14: How Many Relatives and Friends Could You Count On For Help

If you were in trouble, how many relatives and friends could you count on to help you? Would you say none, one to five, six to ten, eleven to fifteen, sixteen to twenty, or more than twenty?

n = 3874

PART 3: Global Warming Awareness and Beliefs

Individuals, policymakers, and societies must be aware of and have at least a basic understanding of a threat to make informed decisions about how to respond. Prior research (Gallup 2010), has found that only 37 percent of Indians nationally say they know "a great deal" or "something" about global warming. This study also found limited awareness of global warming as an issue. Only 7 percent of respondents said that they know "a lot" about global warming, 25 percent said they know "something", and 26 percent said they know "just a little" (Fig. 15). By contrast, 41 percent said they had either "never heard of it" (25%) or "don't know" (16%). It is important to note, however, that lack of awareness of the issue does not mean that individuals have not observed changes in local weather and climate patterns, as evidenced above. This suggests that many Indians may have observed changes in their local climate and weather patterns, without understanding the broader issue of global climate change.

Education level was one of the strongest predictors of climate change awareness. Respondents with higher education were substantially more likely to have heard of global warming than respondents with lower education, especially the non-literate (Fig. 16). But only 13 percent of respondents with a high school graduate degree and above said they knew a lot about global warming, suggesting that overall climate change awareness and literacy remains quite low nationwide.

While many Indians may not be immediately familiar with the issue of "global warming" they do readily accept the idea, however, when given a short description of the phenomenon. The awareness question above was followed by a question with the following short description: "Global warming refers to the idea that the world's average temperature has been increasing over the past 150 years, may be increasing more in the future, and that the world's climate and weather patterns may change as a result. What do you think? Do you think that global warming is happening?" A large majority (72%) of respondents said "Yes", while only 11 percent said "No" and 16 percent said "Don't know" (Fig. 17). Respondents with greater levels of educational attainment were more likely to say yes (80%) (Fig. 18). Non-literate respondents were less likely to say yes (47%) and over a third (37%) again said that they don't know.

A majority of respondents said that if global warming is happening, it is caused mostly by human activities (56%), while 31 percent said it is caused mostly by natural changes in the environment (Fig. 19). Only 2 percent said it is not happening, while 11 percent said they didn't know.

A majority (61%) of respondents said that they are either very (20%) or somewhat worried (41%) about global warming (Fig. 20). By contrast, 29 percent said they are either not very (21%) or not at all worried (8%), while 9 percent said they don't know. Only 20 percent said they were "very worried" about the issue, yet 33 percent said the issue is "very important" to them personally, while another 34 percent said it is "somewhat important" (Fig. 22). Only 25 percent said it was either not very (17%) or not at all important (8%), while 9 percent said they don't know. Respondents with a higher level of education tended to worry more about global warming and to say that it is personally important to them than those with less education, especially the non-literate (Fig. 21 and Fig. 23).

Respondents were then asked how much they thought global warming will harm different people and species. Overall, large majorities said global warming will cause either a great deal or a moderate amount of harm. Large majorities of respondents said global warming will cause "a great deal" or "a moderate amount" of harm to future generations of people (67%), plant and animal species (67%), people in India (66%), people in their own community (62%), and themselves and their own family (57%) (Fig. 24). Very few respondents (8% or less) said that global warming will cause no harm at all.

Many respondents said that people in India are already being harmed by global warming now (21%) or will be within 10 years (22%) (Fig. 25). Others said the impacts will start to harm people in India within 25 years (15%), 50 years (13%), or 100 years (8%). Only 6 percent said that global warming will never harm people in India, while 15 percent said they don't know when this will happen.

Many Indians also believe that global warming will have a variety of dangerous impacts. Almost half of respondents said that global warming will cause many more extinctions of plant and animal species (48%), famines and food shortages (46%), severe heat waves (45%), droughts and water shortages (45%), and disease epidemics (45%) (Fig. 26). About a third of respondents said that global warming will cause many more severe floods (35%) or severe cyclones (32%).

Half of respondents (50%) either strongly (18%) or somewhat (32%) said that they have personally experienced the effects of global warming, while 31 percent somewhat or strongly disagreed, and 19 percent said they don't know (Fig. 27).

Finally, many Indians are still making up their mind about global warming. A majority (58%) said that they either strongly (11%) or somewhat (28%) agree that they could easily change their mind about global warming, with another 19 percent that said they don't know. Only 16 percent of survey respondents said that it would be difficult for them to change their mind about the issue (Fig. 28).

Figure 15: Awareness

How much do you know about global warming? Do you know a lot about it, something about it, just a little about it, or have you never heard of it?

Figure 16: Awareness by Education Level

Figure 17: Is It Happening?

Global warming refers to the idea that the world's average temperature has been increasing over the past 150 years, may be increasing more in the future, and that the world's climate and weather patterns may change as a result. What do you think? Do you think that global warming is happening? Would you say 'yes', 'no', or 'I don't know'?

Figure 19: The Cause

If global warming is happening, do you think it is caused mostly by human activities, by natural changes in the environment, some other cause, or none of these because it is not happening?

n = 3797

Figure 20: Worry

How worried are you about global warming? Would you say you are very worried, somewhat worried, not very worried, or not at all worried?

Figure 21: Worry by Education Level

Figure 22: Personal Importance

How important is the issue of global warming to you personally? Would you say it is very important, somewhat important, not very important, or not at all important?

Figure 23: Personal Importance by Education Level

Figure 24: Who Will Be Harmed?

How much do you think global warming will harm each of the following? Would you say a great deal, a moderate amount, only a little, not at all, or do you not know?

Figure 25: Timing of Impacts on India

When, if ever, do you think global warming will start to harm people in India? Would you say people in India are being harmed now by global warming or people in India will start to be harmed by global warming in 10 years, in 25 years, in 50 years, in 100 years, or never?

Figure 26: Frequency of Impacts

In India, over the next 20 years, please tell me if you think global warming will cause more or less of the following, if nothing is done to address it?

Figure 27: Personal Experience

Please tell me how much you agree or disagree with the following statement: I have personally experienced the effects of global warming.

n = 4000

Figure 28: Certainty of Opinion

Please tell me how much you agree or disagree with the following statement: I could easily change my mind about global warming.

n = 4000

PART 4: Trust in Different Messengers

Global warming joins a long list of other hazards of the modern world that are scientifically complex and about which most people know relatively little. Which risks should one be concerned about? How high of a priority are they? What should individuals and societies do about them? In these situations, many individuals look to trusted individuals, organizations, or institutions to guide them through this landscape of unknown or uncertain hazards. Thus, the messenger is often just as important (if not more so) than the message about risk itself.

Overall, a large majority of survey respondents said they trust scientists (73%), the news media (69%), environmental organizations (68%), and their own family and friends (67%) as sources of information about global warming (Fig. 14). Local, state, and national governments, community leaders, and corporations were trusted by about half of respondents. Finally, religious leaders were trusted by 46 percent of respondents as a source of information about this issue.

Figure 29: Trust

Next I'm going to read you a list of people, groups and organizations. For each one, please tell me how much you trust or distrust each as a source of information about global warming:

PART 5: Support for Climate and Energy Policies

Overall, 41 percent of survey respondents said that the government of India should be doing much more (24%) or more (17%) to address global warming (Fig. 30). Another 8 percent said the government is currently doing the right amount. By contrast, 37 percent said that the government should be doing less (19%) or much less (18%) to address the issue, while another 14 percent said they don't know.

A large majority, however, said that India should be making substantial efforts to reduce global warming, even if this has economic costs. Nearly 1 out of 3 respondents said that India should make a large-scale effort to reduce global warming, even if it has large economic costs (Fig. 31). Another 22 percent supported a medium-scale effort, while an additional 23 percent supported a small-scale effort, even if these have moderate or small economic costs respectively. Only 10 percent said India should make no effort to reduce global warming, while 14 percent don't know.

Just over a third of respondents (38%) said that India should reduce its own emissions immediately without waiting for other countries (Fig. 32), while 18 percent said that India should reduce its own emissions only if rich countries go first and 13 percent said that India should reduce its own emissions only if all the other countries of the world reduce their emissions at the same time. Finally, 13 percent said that India should not reduce its emissions under any circumstances, while 18 percent said they don't know.

Many Indians support a variety of concrete policies related to climate change and energy. Reflecting a desire to learn more, 70 percent of survey respondents said they would favor a national program to teach all Indians about global warming (Fig. 33). There was also strong support (67%) for a national effort to encourage local communities to build check dams to increase local water supplies.

Majorities of respondents favored policies to encourage drivers to waste less fuel by increasing the price on petrol and LPG (55%); households and industry to waste less water by increasing the price of water (54%); requiring new buildings to waste less water and energy, even if this increases their cost (57%); preserving or expanding forested areas, even if this means less land for agriculture or housing; making more electricity from solar and wind power, even if this increases the price of electricity (54%); requiring that new automobiles be more fuel efficient, even if this increases the cost of cars and bus fare (54%); and reducing the number of coal-burning power plants, even if this increases the cost of electricity (53%).

If there was a major disaster in India, a large majority (75%) of respondents said they would strongly (43%) or somewhat favor (32%) having some of the refugees move to

their community to live (Fig. 34). If there was a major disaster in Bangladesh, however, only 51 percent of respondents said they would strongly (20%) or somewhat favor (31%) having some of the refugees move to their community to live, while 26 percent of respondents said they would strongly oppose this (Fig. 35).

Finally, 35 percent of respondents said that protection of the environment improves economic growth and provides new jobs, 16 percent said it has no effect on economic growth or jobs, 31 percent said environmental protection reduces economic growth and costs jobs, and 18 percent said they don't know (Fig. 36). The respondents were subsequently asked, "When there is a conflict between environmental protection and economic growth, which do you think is more important?" A majority (53%) said that protecting the environment is more important, even if it reduces economic growth (Fig. 37). A minority (28%) said that economic growth is more important, even if it leads to environmental problems, while 18 percent said they don't know.

In general, less educated and illiterate respondents are more likely to say "Don't know" when asked about various policies, while those with higher education (graduates and above) and higher incomes are more likely to support most policies.

Figure 30: How Should the Indian Government Respond?

Do you think the government of India should be doing much more, more, less, or much less to address global warming, or is it currently doing the right amount?

Figure 31: Desired Scale of Action

How big of an effort should India make to reduce global warming?

n = 3855

Figure 32: When Should India Reduce Emissions?

Scientists say that gases emitted by motor vehicles, power plants, and factories are causing global warming. Rich countries like the United States have been emitting these gases for many years. Poorer countries like India, however, are also starting to emit these gases as they buy more motor vehicles and build more power plants and factories. People disagree about when India should reduce its own emissions of these gases. Which one of the following statements comes closest to your own point of view?

Figure 18: Policy Support

Please tell me how much would you favor or oppose India taking each of the following steps to help deal with environmental problems:

and industry to waste less

Requiring new buildings

forested areas, even if this means less land for agricul-

Making more electricity from solar and wind power, even if this increases the price of

Requiring that new automobiles be more fuel efficient, even if this increases the cost

coal-burning power plants, even if this increases the cost

Average n = 4000

Figure 34: Willingness to Host Refugees from India

If there was a major disaster elsewhere in India, how much would you favor or oppose having some of the refugees move to your community to live? Would you strongly favor, somewhat favor, somewhat oppose, or strongly oppose having some of the refugees move to your community to live?

Figure 35: Willingness to Host Refugees from Bangladesh

If there was a major disaster in Bangladesh, how much would you favor or oppose having some of the refugees move to your community to live? Would you strongly favor, somewhat favor, somewhat oppose, or strongly oppose having some of the refugees move to your community to live?

Figure 36: Impact of Environmental Protection on Economic Growth

Overall do you think that protecting the environment reduces economic growth and costs jobs, improves economic growth and provides new jobs, or has no effect on economic growth or jobs?

n = 3806

Figure 37: Environmental Protection vs. Economic Growth

50 53% 40 30 28% 20 18% 10 0 Protecting the Economic growth, Don't know even if it environment, even if it leads to reduces environmental economic growth problems

When there is a conflict between environmental protection and economic growth, which do you think is more important?

PART 6: Collective Efficacy and Safe Drinking Water

"Collective efficacy" refers to a group's shared belief that they are able to organize and act together in pursuit of a common goal. Groups with high collective efficacy are more likely to work together to solve common problems, while groups with low collective efficacy have difficulty responding when confronted with a common problem. These questions attempt to assess the degree to which Indians believe that their communities can act effectively together to solve drinking water access, safety, and supply problems.

Only half of respondents said they were confident that their community can work together to increase access to safe drinking water (51%) (Fig. 38), or to make sure that everyone has enough safe drinking water even during difficult times like floods or droughts (47%) (Fig. 39). Likewise, only half of respondents said that in the past year, their community had taken steps to help people waste less water at home (51%) (Fig. 44), while only 39 percent said their community had taken steps to increase the amount of safe drinking water in the past year (Fig. 45).

As individuals, substantial numbers of respondents said they had personally encouraged other members of their community to waste less water (50%) (Fig. 40), participate in community activities to increase the amount of safe drinking water (38%) (Fig. 41), demand that community leaders or government officials improve the amount of safe drinking water (37%) (Fig. 42), or participate in social demonstrations to demand more safe drinking water (24%) (Fig. 43).

Figure 38: Confidence Community Can Increase Safe Drinking Water

How confident are you that your community can work together to increase access to safe drinking water?

Figure 39: Confidence Community Can Ensure Drinking Water During Floods or Droughts

n = 4000

Figure 40: Encouraged Community to Waste Less Water

In the past year, have you encouraged other members of your community to waste less water?

Figure 41: Encouraged Community to Increase Drinking Water

In the past year, have you encouraged other members of your community to participate in community activities to increase the amount of safe drinking water?

Figure 42: Encouraged Community to Demand that Leaders Increase Drinking Water

In the past year, have you encouraged other members of your community to demand that your community leaders or government officials improve the amount of safe drinking water for your community?

n = 3849

Figure 43: Encouraged Community to Demonstrate to Demand Drinking Water

In the past year, have you encouraged other members of your community to participated in social demonstrations – such as "gheroas, rasta rokos, or bands" – to demand more safe drinking water for your community?

Figure 44: Community Helped People to Waste Less Water

In the past year, has your community taken steps to help people waste less water at home?

Figure 45: Community Increased Amount of Drinking Water

In the past year, has your community taken steps to increase the amount of safe drinking water for the community?

PART 7: Values

Overall, respondents tended to hold stronger egalitarian than individualistic values. Large majorities agreed that "in an ideal society, all basic needs (food, housing, health care, education) would be guaranteed by the government for everyone" (76%), supported "government programs to get rid of poverty" (70%), that "discrimination against some social groups is still a very serious problem in our society" (66%), and that "the world would be a more peaceful place if its wealth were divided more equally among nations" (57%) (Fig. 46).

Respondents were relatively less likely to agree that "if the government spent less time trying to fix everyone's problems, we'd all be a lot better off" (71%), "government regulation of business usually does more harm than good" (61%), that "our government tries to do too many things for too many people – we should just let people take care of themselves" (57%), "the government interferes too much in our everyday lives" (57%), and that "people should be allowed to make as much money as they can, even if it means some make millions while others live in poverty" (49%).

Respondents were evenly divided between those that said "individuals can make their own destiny" (38%) vs. "everything in life is the result of fate" (40%) (Fig. 47).

Figure 46: Egalitarianism & Individualism Values

Please tell me if you strongly agree, somewhat agree, somewhat disagree or strongly disagree with each statement.

Figure 47: Individual Destiny Made or the Result of Fate

What do you think - do individuals make their own destiny or is everything in life the result of fate?

PART 8: Media Use

Television was the mostly widely used media source, with 65 percent of respondents reporting that they watch television 5 or more days a week, compared to newspapers (54%), radio (25%), movies (21%), or the internet (18%) (Table 1). News about sports and television and movie stars were the most closely followed types of news (39%), followed by world affairs (36%), local politics (36%), environmental issues (35%), national politics (34%), the local weather forecast (32%), and business and financial news (31%). Finally, a large majority of respondents (80%) said that they watch or listen to serial dramas on television or radio, with 37 percent doing so almost every day, 22 percent several times a week, and 21 percent a few times a month.

Table 2: Media Use

In an ordinary week, how many days in a week do you:

Read a newspaper?

7 days in a week	43

APPENDIX F: Research Organizations and Sponsor

The Yale Project on Climate Change Communication

The Yale Project on Climate Change Communication, in the Yale School of Forestry & Environmental Studies at Yale University, conducts scientific research on public environmental knowledge, risk perceptions, decision-making and behavior and empowers educators and communicators with knowledge, training, and tools to advance public understanding and engagement with climate change science and solutions. We conduct research and outreach at the global, national, state and local levels in partnership with various stakeholders, including government, business, academia, the media, and civil society.

GlobeScan Incorporated

GlobeScan Incorporated is a global opinion research consultancy specializing in public and stakeholder opinion research, with in-depth experience surveying and analysing corporate social responsibility (CSR), environmental, sustainability and climate change issues. Our objective, data driven research and analysis is used to help develop, implement and measure the effectiveness of strategy for the largest global corporations, multilateral institutions, governments and NGOs. We regularly conduct research in 75+ countries, employ advanced analytic methodologies and have over 20 years of proven results. GlobeScan's strategic research is conducted for leadership organizations operating at the global or regional level.

The Centre for Voting Opinion & Trends in Election Research (CVOTER)

CVOTER started as an initiative to act as an interface between the people and the polity. Almost two decades after our journey began, we have not only established ourselves as South Asia's largest Indian Owned media and stakeholder research agency but have also managed to make a foray into both print and electronic media, social research, market research and consultancy services. Backed by state-of-the-art data management and analysis software and a group of highly motivated who look at the future as an era of limitless possibilities, Team Cvoter believes in facilitating communication between people.

Shakti Sustainable Energy Foundation

The Shakti Sustainable Energy Foundation works to strengthen the energy security of India by aiding the design and implementation of policies that support energy efficiency and renewable energy.
